

Database Management Specific Principles:

1. Information is valued as a State asset, which must be capable of being shared and properly managed.
2. Information and its value must be identified and documented by its current keepers or stewards. The metadata must be capable of being universally available so the data contained within can be leveraged by all authorized to use it.
3. Database Systems and data warehouses should be implemented in adherence with all security, confidentiality and privacy policies, and applicable statutes.
4. The State should leverage a data warehouse and data marts to facilitate the sharing of existing information. This data warehouse will contain the one single version of 'the truth'.
